DETECTING WEB ATTACKS WITH END-END DEEP LEARNING

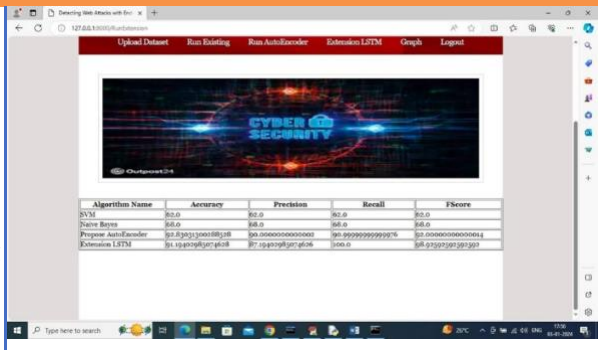
ABSTRACT

The project on "Detecting Web Attacks with End-to-End Deep Learning" addresses the increasing sophistication of web attacks and the need for robust security mechanisms. This project proposes an innovative solution that leverages end-to-end deep learning techniques to detect and mitigate various types of web attacks. The approach involves training a deep neural network to learn patterns and anomalies in web traffic, providing a comprehensive and adaptive defense against malicious activities.

DESCRIPTION

This project focuses on developing a deep learning-based system to detect and classify inappropriate content in videos uploaded to platforms like YouTube. With the rapid increase in online video content, manual moderation has become inefficient and time-consuming. Inappropriate content may include violence, explicit material, hate speech, or misleading information, which can negatively impact viewers and violate platform policies. Therefore, an automated and intelligent detection system is necessary.

The proposed system uses machine learning and deep learning techniques such as Multi-Layer Perceptron (MLP), Autoencoders, and Long Short-Term Memory (LSTM) networks to analyze data and classify content accurately. Unlike traditional rule-based or signature-based systems, which depend on predefined patterns, this approach learns directly from raw data using end-to-end deep learning.



EXISTING SOLUTIONS

1. Manual Log Analysis
2. Rule-Based Intrusion Detection Systems (IDS)
3. Traditional Machine Learning Approaches
4. Feature Engineering-Based Detection Techniques
5. Signature-Based Web Application Firewalls (WAF)

CONCLUSION

The project aims to automate and enhance KOA diagnosis using deep learning. Currently, manual KOA grading is time-consuming and subjective, leading to inconsistencies in diagnosis. Traditional methods rely on expert radiologists, making large-scale screening challenging. In our model, KOA-CCTNet, we leverage Compact Convolutional Transformers (CCT) to classify KOA severity accurately. By using advanced preprocessing, deep learning, and automation, the system provides quick and reliable KOA assessment from X-ray images.
